What Are the Customisation Options for Engraved Metal Tags?

There are many customisation options for metal tags, allowing you to design tags that will fit all your requirements. You might be looking for laser engraving in Toronto because the laser engraving process will not compromise the strength of the tag.

How Tags Are Engraved

The engraving process is a unique one. To create **engraved metal tags** , you can use an engraving machine to carefully scrape away pieces of the metal to create the design or lettering. Because everything must be in perfect alignment, it generally takes longer to engrave tags.

Customising Engraved Name Plates in Canada

Engraving is not the same thing as stamping the tags. Stamping and embossing change the shape of the tag, while the engraving tool scrapes away a small amount of the metal to create the lettering.

Because some of the material of the tag is being taken away, the tag needs to be thicker at the beginning. If you are looking for a thin metal tag, engraving may not be the best option for you.

Photo anodization may be a better option in this case. However, there are many options for your engraved metal tags, making them a perfect option for many industries.

- **Adding colour inside:** After the tag has been engraved, you can add colour inside each new hollow. This makes the lettering or design more visible. It can also provide a more attractive look than a standard metal tag. However, you should remember that certain types of materials, such as stainless steel, may not be as conducive to colour inlays. You should also be aware of the environment you will use this tag in.
- **Tag design:** You can use the metal tag to showcase your brand and the best parts of it. You can choose to place information about your company on the tag, such as name and location. You can also choose the shape of the tag itself. For example, rounded corners may provide a more professional look for the tag.
- **Type of material:** There are many types of metals you can choose from for your tags, including brass, stainless steel, and aluminum. Keep in mind the industry you will be using your tag in. For example, aluminum is very lightweight, making it ideal for aerospace, but certain chemicals can cause it to corrode.

Turn to a Trusted Source for Engraved Name Plates in Canada

If you are looking for laser engraving in Toronto, choose Identifab Industries Limited for a quality product. We have years of experience and we can work with you to ensure that your customised product is precisely to your requirements. Call us today so we can help you with your needs.
